Last Updated: January 2025

This lens studio project aims to create an augmented reality experience for snapchat with bitmoji. When the effect is loaded, and while looking through the front camera, an bitmoji head of the account holder will be placed on the user's head.

Bitmoji Head is a custom component designed to animate the Bitmoji Head to mimic a Snapchatter's facial expressions.

We will be setting up the account, gather all the downloadable resources, prepare some assets. Install and setup lens studio to start a new project.

Download the project files

[↪ Link](#)

Download the project files for animated dancing bitmoji from github repository. Click on the green "Code" button to download.

Snapchat account

[↪ Link](#)

Go to the official Snapchat website and create a Snapchat account, then login.

Download lens studio

[↪ Link](#)

Downloading the latest lens studio available [5.6 or later]

Open lens studio 5.6+

Open the lens studio. Login to your snapchat account.

New Project

Create a blank project, not templates. Save the project with "ctrl+s" / "cmd+s" to you desired location.

We'll add the necessary assets and begin configuring the project.

Adding assets from library

- Open the assets library [found above the "scene hierarchy"].
 - Search for "Bitmoji 3D", "Bitmoji Head" components and add them.
-

Adding assets to scene hierarchy

Add both "Bitmoji 3D" and "Bitmoji Head" into the scene hierarchy.

Adding the "Head"

- Select the "Bitmoji Head" object.
 - On the inspector panel, drag and drop
 - "Bitmoji 3D" object into Bitmoji 3D slot
 - "Camera" object into Camera slot
 - Enable "Attach to Head"
-

Lighting

Delete the default lighting group and light objects inside it.

We'll test the effect on our mobile device and upload it to Snapchat for global use.

Preview lens

- On the top right of the screen near the publish button, you can choose to pair with your mobile device using your snapchat account.
- Select "Pair new Snapchat Account" and a SnapQR* will be shown.
- Open your snapchat and point the camera to the SnapQR.
- You will receive the prompt to continue the pairing process.
- Once paired the lens will send to your device.

*SnapQR can only be scanned using a snapchat camera. Normal QR code readers won't work with SnapQR.

Automating lens previews

- Click on Lens Studio on top left and select "Preference".
 - Send to Device > Send on Project Save: Snapchat Only.
-

Publish

- On the top-right, select "Publish" to open the project settings window.
 - You can add or change the Lens Name, Platforms, Previews and Icons.
 - Once customized, you can again select "Publish".
 - That will guide you to the snapchat website. Follow the instructions and your effect will be published in a while.
